BUREAU OF EPIDEMIOLOGY

1100 West 49th Street, Austin, Texas 78756 (512-458-7207)

## ANNUAL SUMMARY ISSUE

In 1984, a number of significant changes were made in the content and methods of surveillance of reportable diseases in Texas.

- A microcomputer system was installed to eliminate duplicate reports and generate graphic reports.
- Reports by telephone (using the WATS line 1-800-252-8239) were accepted as substitutes for written reports on the C-15 card.
- Extensive efforts were made to obtain uniform information about each reported case including the date of onset and type of laboratory confirmation.
- Eight new diseases were made reportable: bacterial meningitis, campylobacteriosis, coccidioidomycosis, dengue, histoplasmosis, legionnaire's disease, toxic shock syndrome, and viral hemorrhagic fevers.
- Two diseases were removed from the list of reportable diseases: rheumatic fever and smallpox.

For these reasons, the summary data included in this issue are not directly comparable to past years. However, these figures represent improved estimates of disease activity and the effectiveness of public health efforts in the state of Texas. More detailed analyses are available from the Bureau of Epidemiology upon request. The following graphs of representative diseases are presented to illustrate the marked seasonal variations among communicable diseases. Note that Campylobacteriosis was not required to be reported until August 1984.
